# Reviving Iterative Training with Mask Guidance for Interactive Segmentation 

Konstantin Sofiiuk, Ilia A. Petrov* and Anton Konushin**

Visual Understanding lab., AI Center Moscow, Samsung Electronics Co., Lesnaya 5C, Moscow, Russia

| RITM | icip2022 | 36 |
| :---: | :---: | :---: |
| EdgeFlow | iccv2021 | 17 |
| CDNet | iccv2021 | 13 |
| FocalClick | cvpr2022 | 6 |
| FocusCut | cvpr2022 | 4 |
| PseudoClick | eccv2022 | 2 |

## Task

class agnostic segmentation with user's input

## Pipeline

The key difference is in the user input:
its main aspects are the encoding and processing of the encoded input

## encoding

Disks with a small radius

The changes in disk encoding caused by adding new points or moving existing ones are always local and only slightly affect the encoding map.

A distance transform map can change drastically when a new point is added, especially if there are only a few points. In turn, such sudden considerable changes might confuse a network.

## processing of the encoded input

DMF

Conv1E

## Iterative Sampling Strategy

for click_indx in range(num_iters):

```
output = self.net(img, points)
points = get_next_points(output, gt_mask, points)
```

## Iterative Sampling Strategy + Random Sampling Strategy

random sampling is used for initialization and then a few clicks are added using the iterative sampling procedure

## Incorporating Masks From Previous Steps

- providing additional prior information that can help improve the quality of prediction
- Our model takes this mask as the third channel together with two channels for positive and negative encoded clicks, respectively.

[ R, G, B, foreground click, background click, previous mask]

## Normalized Focal Loss

$$
\begin{aligned}
& F L(i, j)=-\left(1-p_{i, j}\right)^{\gamma} \log p_{i, j} \\
& P(\hat{M})=\sum_{i, j}\left(1-p_{i, j}\right)^{\gamma} \\
& N F L(i, j, \hat{M})=-\frac{1}{P(\hat{M})}\left(1-p_{i, j}\right)^{\gamma} \log p_{i, j}
\end{aligned}
$$

$P(\hat{\mathcal{M}})$ decreases when the accuracy of the prediction increases
The gradient of NFL does not fade over time due to normalization

## Evaluation metric

Number of Clicks (NoC):
the number of clicks required to achieve the predefined IoU

NoC@85
NoC@90
eg:

| NoC@85\% | NoC@90\% |
| :---: | :---: |
| 1.54 | 1.68 |

clicks limit $=20$

| Method | GrabCut |  | Berkeley | SBD |  | DAVIS |  | Pascal VOC |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Ablation Studies

## Table 1

Ablation studies of the network architecture choices described in Section 3.1. Each cell consists of two results "X/Y", where "X" and "Y" correspond to evaluation without and with f-BRS-B[4], respectively. "DT" stands for the distance transform clicks encoding. All models are trained on SBD.

| Backbone | Input | Clicks | $\mathrm{NoC}_{20}$ @90 |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Scheme | Encoding | Berkeley | DAVIS |
| ResNet-34 | DMF [4] | DT | $5.50 / 4.32$ | $8.45 / 8.34$ |
|  | Conv1E | DT | $4.79 / 4.43$ | $7.56 / 7.60$ |
|  | Conv1S | DT | $4.98 / 4.16$ | $7.41 / 7.28$ |
|  | Conv1S | Disk3 | $4.52 / 4.04$ | $7.27 / 7.18$ |
|  | Conv1S | Disk5 | $4.09 / 3.89$ | $6.92 / 7.22$ |
| HRNet-18 | DMF [4] | DT | $4.93 / 4.35$ | $8.59 / 8.00$ |
|  | Conv1E | DT | $4.41 / 3.95$ | $7.50 / 7.43$ |
|  | Conv1S | DT | $3.99 / 3.81$ | $7.16 / 7.24$ |
|  | Conv1S | Disk3 | $3.63 / 3.47$ | $7.14 / 7.04$ |
|  | Conv1S | Disk5 | $3.52 / 3.50$ | $6.90 / 6.97$ |

HRNet-18 and ResNet-34 models with Conv1S show better performance
Disk encoding significantly improves results of both HRNet-18 and ResNet-34

## Disk + Conv1S + HRNet

## Ablation Studies

| Method | $\mathrm{NoC}_{20} \mathrm{Q90}$ |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | GrabCut | Berkeley | SBD | DAVIS |
| BCE | 1.82 | 3.13 | 7.58 | 6.31 |
| Soft loU | 2.02 | 3.03 | 7.94 | 6.45 |
| FL | 1.80 | 3.28 | 7.56 | 6.40 |
| NFL | $\mathbf{1 . 7 0}$ | $\mathbf{2 . 4 8}$ | $\mathbf{6 . 7 2}$ | $\mathbf{5 . 9 0}$ |

NFL leads to better accuracy and convergence on all 4 datasets

## Ablation Studies

| $N_{\text {iters }}$ | Prev | $\mathrm{NoC}_{20}$ @90 |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Mask | Berkeley | DAVIS | SBD |
| 3 | - | 2.38 | 5.92 | 6.49 |
| 3 | + | 2.26 | 5.74 | 6.06 |
| 1 | + | 2.57 | 5.81 | 6.15 |
| 2 | + | 2.48 | 5.70 | 6.10 |
| 3 | + | 2.26 | 5.74 | 6.06 |
| 4 | + | 2.52 | 6.03 | $\mathbf{6 . 0 4}$ |
| 5 | + | 2.49 | 5.98 | 6.24 |
| 6 | + | 2.55 | 6.11 | 6.82 |

too high $N$ values (>4) lead to instability during training and to worse results

GrabCut

## Ablation Studies

model that takes a mask from a previous step is much more stable and converges to a better loU
